One thing I learned from the open-source videos is how much of the technology we use every day is built and maintained by communities rather than big companies. Seeing how much we rely on open-source software made me realize how important collaboration is in the tech world. The intro story from *The Linux Command Line* also showed the potential for growth open-source projects have when people can collaborate and build on each other's ideas. That openness gives users more control and transparency, which is something closed-source software can't really offer. It also creates a better learning environment because developers can study real code instead of guessing how things work. Overall, I learned that open-source succeeds because it turns software into a shared effort instead of something only a certain company can do.

1. Open source isn't just "free software," it's really about freedom, like being able to use it, change it, and share it however you want.
2. A lot of software used to be controlled by private companies, but open source started growing in the 80s and really blew up with Linux.
3. Companies can still make money with open source, like Red hat, by mixing free versions with paid products.
4. Open source projects are built around repositories, which are basically places like Github where people can access and work on the code.
